Implications of the ethical-legal framework for adolescent HIV vaccine trials – report of a consultative forum

Catherine Slack, Ann Strode, Catherine Grant, Cecilia Milford

Adolescents in South Africa are at high risk of HIV infection. In 2002 it was estimated that 9.3% of youth (15 - 24 years) were HIV infected.1 Another survey in 20032 reported that 10.2% of this same age group were infected. In the 15 - 19-year age group, 4.8% of youths were reportedly infected with HIV.1 The participation of children in research, including HIV vaccine trials, ensures their fair access to safe and efficacious products. Adolescents are, however, a vulnerable group and their participation raises complex ethical and legal issues.

South African ethical-legal framework

The ethical-legal framework governing child research in South Africa is currently in transition. Firstly, a comprehensive new legislative framework for health research is being implemented through the National Health Act:3 Secondly, the legislation relating to children is being reviewed and consolidated into a Children’s Bill.4 Thirdly, a number of new ethical guidelines relating to children is being reviewed and consolidated into a part of the National Health Research Ethics Committee.

The South African ethical-legal framework and its implications for adolescent HIV vaccine trials were debated at a forum convened by the HIV AIDS Vaccines Ethics Group in July 2004 for key stakeholder groups. At this forum participants discussed the complexities posed by a transitional and sometimes contradictory ethical-legal framework and how the framework could be improved to simultaneously promote critical research and the welfare of child participants.

The major themes and recommendations of the forum are presented here.

Key outcomes

The South African ethical-legal framework is in a state of flux due to legislative and ethical guideline changes

Key problems raised at the forum included: (i) although the National Health Act3 has been passed by parliament not all aspects of the Act have been implemented; (ii) the regulations that accompany the Act3 that contain much of the detail regarding its practical application have yet to be finalised; (iii) the Children’s Bill,4 which proposes considerable amendments to the health rights of children, has not yet been passed by parliament; and (iv) it is uncertain when the revision of key ethical guidelines will be finalised.5

As a result investigators, RECs and other stakeholders face an uncertain ethical-legal environment. For example, Section 71(2) of the National Health Act1 requires consent from both the parent/guardian and the child, regardless of age, for all research including ‘therapeutic’ research. Unlike existing and proposed children’s legislation, the Act does not provide for a child of a specified age or capacity to give independent consent. For example, section 39 of the Child Care Act (Act No. 74 of 1983) allows a child of 14 years to consent independently to ‘medical treatment’, which legal scholars and RECs have

Representatives of a variety of stakeholder groups including research ethics committees (RECs) and community advisory boards were invited to the forum that aimed to: (i) identify the complexities posed by the current ethical-legal framework and implications for HIV vaccine trials, with a focus on child participation (including adolescents); and (ii) work towards consensus on how to enhance the current framework so that it would facilitate sound research and protect trial participants.

The major themes and recommendations of the forum are presented here.

Key outcomes

The South African ethical-legal framework is in a state of flux due to legislative and ethical guideline changes

Key problems raised at the forum included: (i) although the National Health Act3 has been passed by parliament not all aspects of the Act have been implemented; (ii) the regulations that accompany the Act3 and that contain much of the detail regarding its practical application have yet to be finalised; (iii) the Children’s Bill,4 which proposes considerable amendments to the health rights of children, has not yet been passed by parliament; and (iv) it is uncertain when the revision of key ethical guidelines will be finalised.5

As a result investigators, RECs and other stakeholders face an uncertain ethical-legal environment. For example, Section 71(2) of the National Health Act1 requires consent from both the parent/guardian and the child, regardless of age, for all research including ‘therapeutic’ research. Unlike existing and proposed children’s legislation, the Act does not provide for a child of a specified age or capacity to give independent consent. For example, section 39 of the Child Care Act (Act No. 74 of 1983) allows a child of 14 years to consent independently to ‘medical treatment’, which legal scholars and RECs have
interpreted as allowing children over 14 to consent independently to ‘therapeutic’ research.’

Researchers will now face new legal requirements that may affect recruitment and informed consent processes. Although the National Health Act3 will not operate retrospectively, once it is implemented researchers may have to change current practices if they are not in line with the new provisions.

Aspects of the emerging ethical-legal framework are ambiguous and inconsistent

Key problems raised at the forum included:

1. The National Health Act3 retains the contested distinction between ‘therapeutic’ and ‘non-therapeutic’ research in its provisions relating to research with children, despite the fact that most research contains interventions not intended to confer direct benefit to participants. It does not define either term.

2. It is not clear how the different phases of HIV vaccine trials would be classified in terms of the above distinction.

3. If HIV vaccine trials are classified as ‘non-therapeutic’ research (as early trials might be) the risk standard of ‘not significant’ risk must be met. There was some debate as to whether the above term introduced a more relaxed standard of risk for research involving children or alternatively whether it was substantively identical to current risk standards (routine tests or daily life). There was some debate as to whether the risks of HIV vaccine research (such as vaccine administration, risk assessments) could meet this standard set by the National Health Act.7

4. There are many inconsistencies between the National Health Act3 and other critical pieces of legislation such as the Children’s Bill4 which provides for independent consent arrangements with the other three increasingly well-harmonised guidelines.8 As a result, there are many instances in which child research participants do not have explicit legal protection in South African law.

5. It is the MRC’s General Principles6 that are most disjunctive with the other three increasingly well-harmonised guidelines.9-11 As a result of these ambiguities and inconsistenciesREC members reviewing trials and researchers planning trials may struggle to screen out ‘unethical’ or unlawful research practices involving child participants.

In some instances, the ethical-legal framework does not protect child welfare or promote critical research as effectively as possible

The following issues were discussed:

1. Section 71 of the National Health Act3 purports to deal with the rights of children participating in research; however, it focuses on informed consent without considering other protections such as a child’s right to privacy. As a result, there are many instances in which child research participants do not have explicit legal protection in South African law.

2. The National Health Act3 creates additional procedural requirements that may burden investigators and RECs, e.g. when ‘non-therapeutic’ research is conducted on children then ‘authorisation from the Minister’ must be obtained.14 Furthermore, the Minister is obliged to follow guidelines set down in the Act, in determining whether authorisation for non-therapeutic research should be approved. Concerns were raised regarding: (i) how this provision would operate in practice; (ii) whether it would delay research classified as ‘non-therapeutic’; and (iii) how the Minister would interpret poorly drafted requirements such as that research may only be authorised if the parent or minor’s reasons for consenting to the research are not contrary to public policy.

3. Certain ethical guidelines are restrictive in their approach, e.g. the Medical Research Council’s General Principles6 permit parents to enroll their children in ‘non-therapeutic’ research only if it is ‘observation’ research, and research with risks not exceeding everyday life. This approach may prevent the enrolment of healthy children in intervention research such as clinical trials of prevention products.

Recommendations

A number of recommendations were made at the forum to promote a more coherent framework that facilitates critical research with child participants, including adolescents, while promoting their rights and welfare. These included the following.

September 2005, Vol. 95, No. 9  SAMJ
Capacity should be built for stakeholders to better understand the strengths, weaknesses and implications of the framework, and mechanisms should be developed to allow them to impact on the framework.

It was recognised that in many instances stakeholders felt unable to participate in the ethical-legal framework or impact on its development because of a lack of capacity. Accordingly it was recommended that: (i) the capacity of community representatives, RECs and investigators should be developed to enable them to understand the relevant laws and guidelines, and their interpretation in relation to HIV vaccine research; (ii) an accurate understanding of the perspectives and concerns of participating communities should be established through sensitive research and consultation; and (iii) mechanisms should be developed whereby stakeholders, such as RECs, can liaise on the interpretation of laws or guidelines in order to aspire towards consistent protocol review.

Law reform and the revision of ethical guidelines is required

The following was recommended: (i) input should be made to the regulations that will accompany the National Health Act in order to resolve certain inconsistencies and ambiguities in the Act; (ii) proposals to include the rights of child research participants in the Children’s Bill should be supported; and (iii) revisions should be made to ethical guidelines that ensure their harmonisation and ability to protect child participants while accommodating sound research.

Appropriate tools should be developed

It was recommended that tools and tests should be developed to facilitate the appropriate implementation of a number of the new requirements set out in the National Health Act including: (i) children’s ‘understanding’ of research participation; (ii) determining ‘public policy’; and (iii) determining the ‘best interests of the child’.

In conclusion, a transitory and inconsistent framework complicates research involving adolescent or child participants. Considerable training, law reform, guideline amendment and tool development are required to better protect these participants and to facilitate critical research to promote their health.

The authors would like to thank members of the South African AIDS Vaccine Initiative’s Adolescent Working Group for their comments on the paper, and in particular Dr C Metcalf. The paper could not have been written without the input of the participants at the forum held by the HIV AIDS Vaccines Ethics Group.

HAVIEG is funded by the South African AIDS Vaccine Initiative.
